

Travel Companion App

Week 7 | 03/27 - 04/02

Leader: Allen Paul

Varun Mange Time Spent 11h	Tasks completed: • Read Google Maps API docs and became familiar with the API • Wrote a script to extract information of the top 50 tourist places for a given region using the Google Maps places API • Download images for each of these places and uploaded them to our object storage bucket • Looked into Cloudflare CDN and workers to securely serve our images and prevent abuse • Worked on the scaling strategy document, laying out a roadmap of handling 100,000 concurrent users in our application • Currently working on setting up our vps in the US region, updating the Dockerfile and docker compose, setting up our domain name with SSL, and setting up the CDN. Planned tasks for next week: • Finish the deployment part • Setup caching using Upstash • Train the Travel LLM now that we have good data • Build the Map and Explore screens Any issues or challenges: •
Allen Paul 10 hrs Time Spent	Tasks completed: • Helped continue backend API dev for trips, itinerary - related features and destinations. • Worked on integrating interactive map and checking compatibility with frontend navigation flows. • Debugged some API responses and resolving DB connection issues. • Implemented and tested offline storage behavior so users can use the app without the internet. Planned tasks for next week: • Improve offline sync. • Integrate additional frontend features with backend APIs. Any issues or challenges: • Synchronize offline data with backend updates create inconsistencies. • API endpoints need reconstruction.
Darius Rafeh	Tasks completed:

Time Spent 10h	• UI/UX improvements to the frontend social feature screens: profile icon, when pressed there is a list containing profile and settings • Created the backend for social connect, profile, and messaging • Wired to the main app and protected by oAuth when handling API requests Planned tasks for next week: • Test the backend features Any issues or challenges: •
Kapil Yadav Time Spent 11h	Tasks completed: • Built edit itinerary item feature. tapping an itinerary item now opens a pre-filled edit modal with date/time pickers • Implemented silent token refresh. API client now intercepts 401 responses, automatically calls POST /auth/refresh to get a new JWT, and retries. Prevents users from getting randomly logged out when their access token expires • Created user profile API module and wired it to the settings screen with an inline edit form for name and username, with uniqueness validation • Replaced loading spinners on the Home screen with animated skeleton placeholder cards that shimmer while data loads • Added 300ms debounced search on destination queries across trip creation and Explore tab to reduce unnecessary API calls • Added rate limiting middleware on auth routes (10 requests/min/IP) to prevent brute-force login attempts Planned tasks for next week: • Any issues or challenges: •

Total Time Spent: 42h

Summary:

We worked on the scaling strategy document, creating a plan for handling 100,000 concurrent users. Varun worked on setting up the object storage/CDN and improving our deployment process. Darius continued working on the social connect feature and built the backend for it. Kapil added the edit itinerary item feature, implemented refresh token logic, made UX improvements, and added a rate limiting middleware. Allen also worked on the itinerary screen.
