

Travel Companion App

Week 6 | 03/23 - 03/26

Leader: Varun Mange

Varun Mange Time Spent 12h	Tasks completed: • Merge our code from previous week to the main branch • Improved upon the language guide feature by supporting TTS in different languages • Updated the language guide UI and fetching interface • Studied and watched several videos on production, deployment, CI/CD, Docker, and CDNs • Created a Dockerfile to build a docker imager for our backend • Created a Github Action workflow to run tests, create a release, build/publish docker image, and deploy the latest docker image on VPS • Setup a free VPS on Oracle Cloud and deployed our backend docker image • Used Caddy as a reverse proxy • Started planning about the Maps screen and the AI chatbot Planned tasks for next week: • Fix some issues in the github action workflow • Improve the Github Action so that we can control each part individually • Introduce caching in the github action • Setup an object store and CDN for static assets • Build the Maps screen • Start working on fine tuning the AI chatbot Any issues or challenges: • Setting up the Dockerfile and Github Action was a complicated process, faced several issues in downsizing the Dockerfile and ensuring the github action runs completely. • I do not know if we are following the best process by first testing our program in a normal runtime, then building a docker image, uploading it, and then pulling it on our VPS. Will it be better to directly pull our code on the VPS and run it without docker?
Allen Paul Time Spent: 10h	Tasks completed: • Researched the existing authentication architecture by prompting Cursor to analyze the codebase, identifying the existing JWT-based auth system (register, login, refresh, logout), the Prisma schema, and the "OAuthAccount" model that was already in place • Confirmed the existing "User" model had "passwordHash" as optional and already had an "oauthAccounts" relation, meaning no schema

	migration was needed - Installed “google-auth-library” into “apps/api” using “pnpm -C apps/api add google-auth-library” Implemented “POST /api/v1/auth/google” endpoint including: - Google ID token verification via “google-auth-library” - Find-or-create user logic (existing OAuth account, existing email user, or brand new user) - Matching the existing “AuthResponse” shape exactly “{ user: { id, email, name, username }, accessToken }” - Refresh token set via HTTP-only cookie using existing “setRefreshCookie()” helper Implemented “POST /api/v1/auth/apple” endpoint including: - Apple identity token verification using “jose” (already installed) against Apple's JWKS endpoint - Same find-or-create user logic as Google - Graceful handling of missing “name” field (Apple only sends it on first sign-in) - Same “AuthResponse” shape and cookie pattern Verified both implementations with “pnpm -C apps/api typecheck” — both pass Planned tasks for next week: - Mobile implementation. Wire up google and apple sign in button. Any issues or challenges:
Darius Rafeh Time Spent 9h 30m	Tasks completed: - Read through cursor’s documentation to set up cursor rules - Created Screens for our Social Features (Profile, Social Connect, messaging screens) - Made sure features aligned with the project spec Planned tasks for next week: - Create backend for the social features - Refine view screens for social features Any issues or challenges: - Modifying few files to bypass auth for demo purposes
Kapil Yadav Time Spent 11h	Tasks completed: - Fixed the trip bugs. - Replaced all text date inputs with native date pickers — trip creation and itinerary item modal now use @react-native-community/datetimepicker with smart constraints (end date can't precede start, item dates locked to trip range, start/end time pickers for itinerary items). - Added trip editing — edit button on trip detail screen opens a modal

	to change title and dates, calls the existing PATCH endpoint. • Rewrote the Explore tab — was a placeholder, now fetches real destinations from the API with search, shows horizontally scrollable place cards with ratings and category badges for each destination. • Home screen polish — trips grouped into Active/Upcoming/Past sections, contextual badges ("Day 2 of 5", "In 3 days"), pull-to-refresh. • Itinerary progress bars — visual completion bar + count on both the trip detail screen and the itinerary tab. • Trip creation UX — selected destination shows as a dismissible chip, trip duration preview ("5 days in Tokyo, Japan"), smarter date validation. Planned tasks for next week: • Maps • Work with team to figure out what's needed Any issues or challenges: •
--	--

Total Time Spent: 42h 30m

Summary:

Darius and Kapil worked on building/fixing the social connect and itinerary builder respectively. Varun and Allen worked on stepping up a Dockerfile, Github Action CI/CD pipeline, and a VPS on Oracle Cloud. Allen finished implementing the OAuth logic. Next week, our focus is caching, maps, adding more places and images, and AI chatbot.
