

Travel Companion App

Week 5 | 03/06 - 03/12

Leader: Varun Mange

Varun Mange Time Spent 12 h	Tasks completed: • Created a light and dark mode theme for the application • Refactored the onboarding, login, and register screens to make them look consistent • Connected the login/register with the backend, and added stage management to persist auth • Performed error handling to show meaningful error messages on the frontend. • Created the the backend routes for the language guide feature, added pagination • Created the language guide screen to allow users to pick a language and translate words/phrases to the language • Added text-to-speech (TTS) to read out the phrases • Tested backend API routes using Postman Planned tasks for next week: • Finish the language guide feature by: ◦ Supporting audio playback from a remote source ◦ Using divergent voice/language for the local TTS • Start working on the Map screen and integrate Mapbox SDK • Start working on the local LLM and fine-tuning it Any issues or challenges: • Expo Go has different behavior on an Android emulator and on an actual Android device. This leads to unnecessary runtime errors • Several expo packages function differently for Android and iOS, leading to more complications.
Allen Paul Time Spent 10h	Tasks completed: • Studied Cursor further • Researched process for creating authentication and authorization with Google and Apple • Worked on implementing OAuth for Google and Apple Planned tasks for next week: • Complete OAuth for Google and Apple Any issues or challenges: • Learning curve in creating OAuth. • Ensuring that Cursor isn't changing more than it needs to.

Darius Rafeh Time Spent 10h	Tasks completed: • Researched on guidelines to better use Cursor • Synced with current Github Repository and set up additional prerequisites in order to start development • Created mobile app Home screen/dashboard • Worked on frontend for Itinerary Builder/Trip Manager Planned tasks for next week: • Completely finish Itinerary Builder/Trip Manager Any issues or challenges: • Difficulties testing builder and trip screens locally since the onboarding, signup, and login screens tries to validate with the backend • Difficulties with AI Model Hallucinations
Kapil Yadav Time Spent 14h	Tasks completed: • Fixed the API client so every protected request actually sends the Bearer token from the auth store. Before this, anything past login was hitting 401s. • Built a settings screen with sign out. Shows the user's profile info, taps through a confirmation dialog, clears auth state and redirects to login. • Built the trip creation screen with live destination autocomplete hitting the backend, plus title and date fields validated with Zod. After creating, it invalidates the trip list so Home updates instantly. • Rewrote the Home screen to fetch real trips from the API. Each trip card shows the destination, date range, and an Active/Upcoming/Past badge. Empty state when you have no trips yet. • Built the trip detail screen showing trip info and itinerary items grouped by day. You can add items through a bottom sheet modal, mark them done with a checkbox, or delete them. All wired to the backend with optimistic cache invalidation. • Rewired the Itinerary tab to show the active trip's itinerary with a progress counter and a link to the full detail view. Handles empty states for no trips and no active trip selected. Planned tasks for next week: • Look into explore tab, just go deeper into each tab • Look over offline stuff Any issues or challenges: •

Total Time Spent: 46 hours

Summary:

We started by creating a standard light/dark theme for the frontend, and distributing the work for the major screens amongst ourselves. Varun connected the login/register to the backend and started working on the language guide screen. Allen started working on implementing Google and Apple OAuth. Darius and Kapil worked on trip creation, trip management, and itinerary builder screen. Kapil modified the API client to include the auth token and also create a settings page to allow users to logout.
